White House to Tie Hard-Line Conditions Into 'Dreamers' Deal

By MICHAEL D. SHEAR 8:27 PM ET

- In exchange for letting the young undocumented immigrants known as Dreamers stay in the U.S., the White House will push for terms that include a crackdown on children fleeing Central America.
- The deal will also insist on the construction of a wall across the southern border.

More Than 1,000 ISIS Fighters Surrender

By ROD NORDLAND

The militants turned themselves in after the latest in a string of humiliating defeats in Iraq and Syria. Many claim not to have been soldiers, but only cooks or clerks.

2:35 Suspected ISIS Members Surrender in Iraq

A Family Battle With Opioids

By JUDY CHUCHELI

A friend, reflecting on his son's opioid journey, once remarked, "I wish I'd held him closer." Is it ever close enough?

content

} NOT "content"

`content::WebContents`

sandboxed renderer process

Blink

pixels

Operating System

Device Driver

```
#include <GL/gl.h>
```

- textures
- shaders
- vertex buffers
- ...

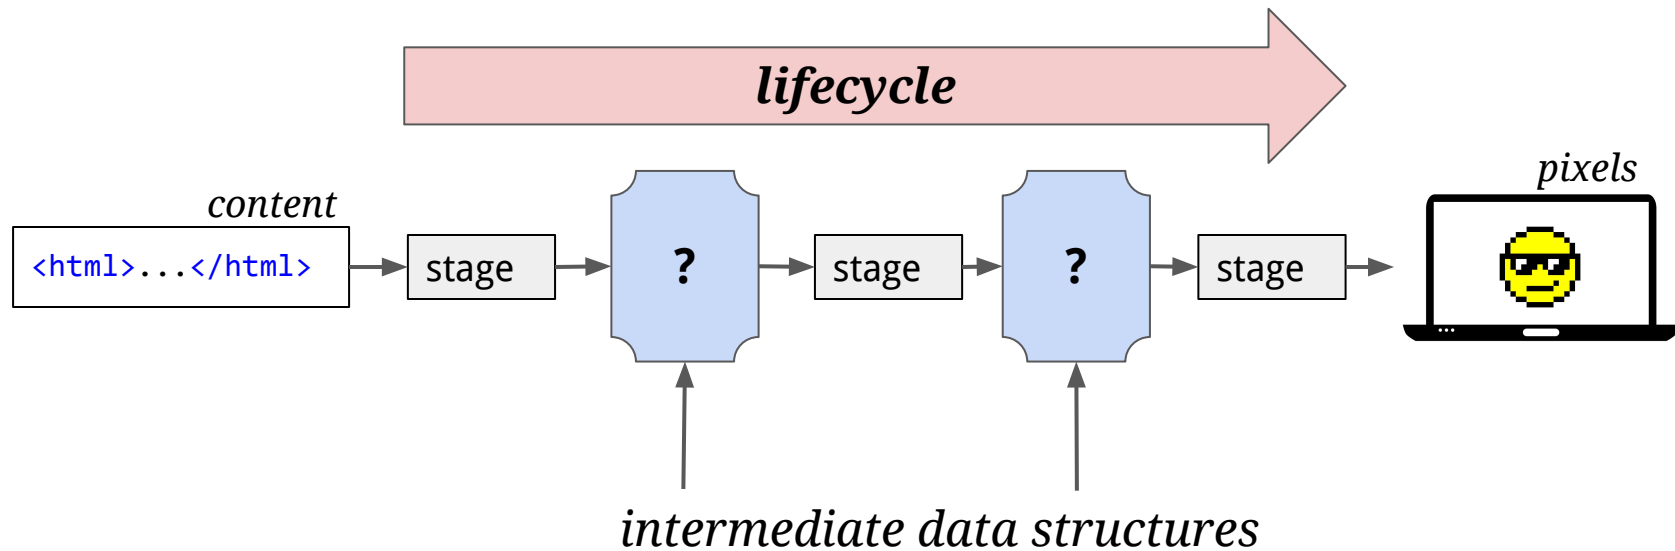

goals

1. *render content into pixels*
2. *build data structures to enable **updating** the rendering efficiently*

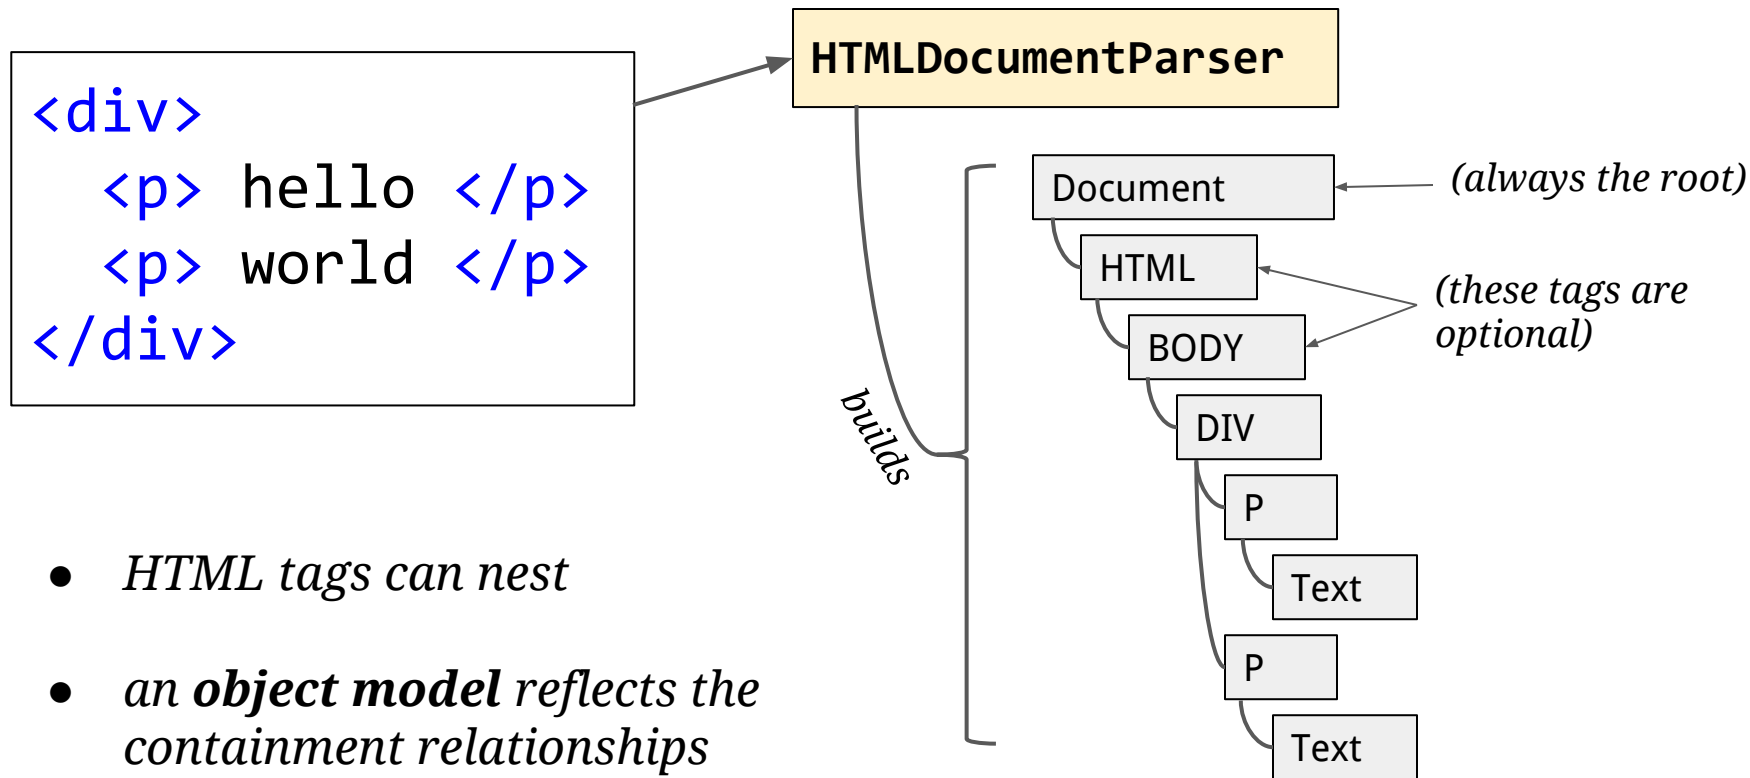

- JavaScript
- user input
- asynchronous loading
- animations
- scrolling
- zooming

stages

parsing

DOM

*This is the
**Document
Object
Model.***

*The DOM
is a tree!*

- *parents*
- *children*
- *siblings*

DOM

The DOM is both

- *Chrome's internal representation*
- *AND*
- *the API exposed to JavaScript*

```
var div = document.body.firstChild;  
var p2 = div.childNodes[1];  
p2.appendChild(document.createElement("span"));  
p2.foo = {arbitrary: "state"};
```

[JS]

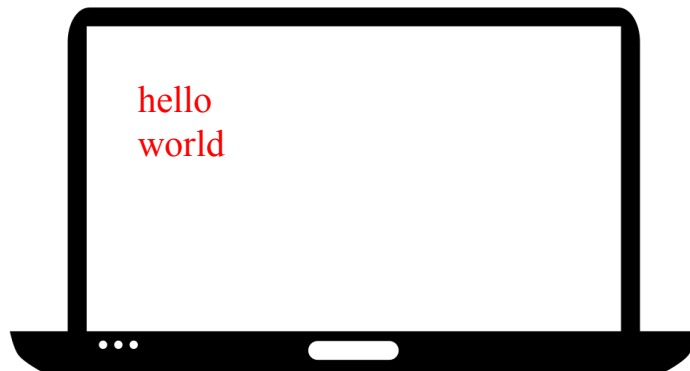

style

```
/* every <p> has red text */  
p { color: red }
```

selects

style

font-weight: bold;

hello

margin-left: 2cm;

hello

outline: dashed blue;

hello

transform: rotate(20deg);

hello

background: url(kitten.jpg);

hello

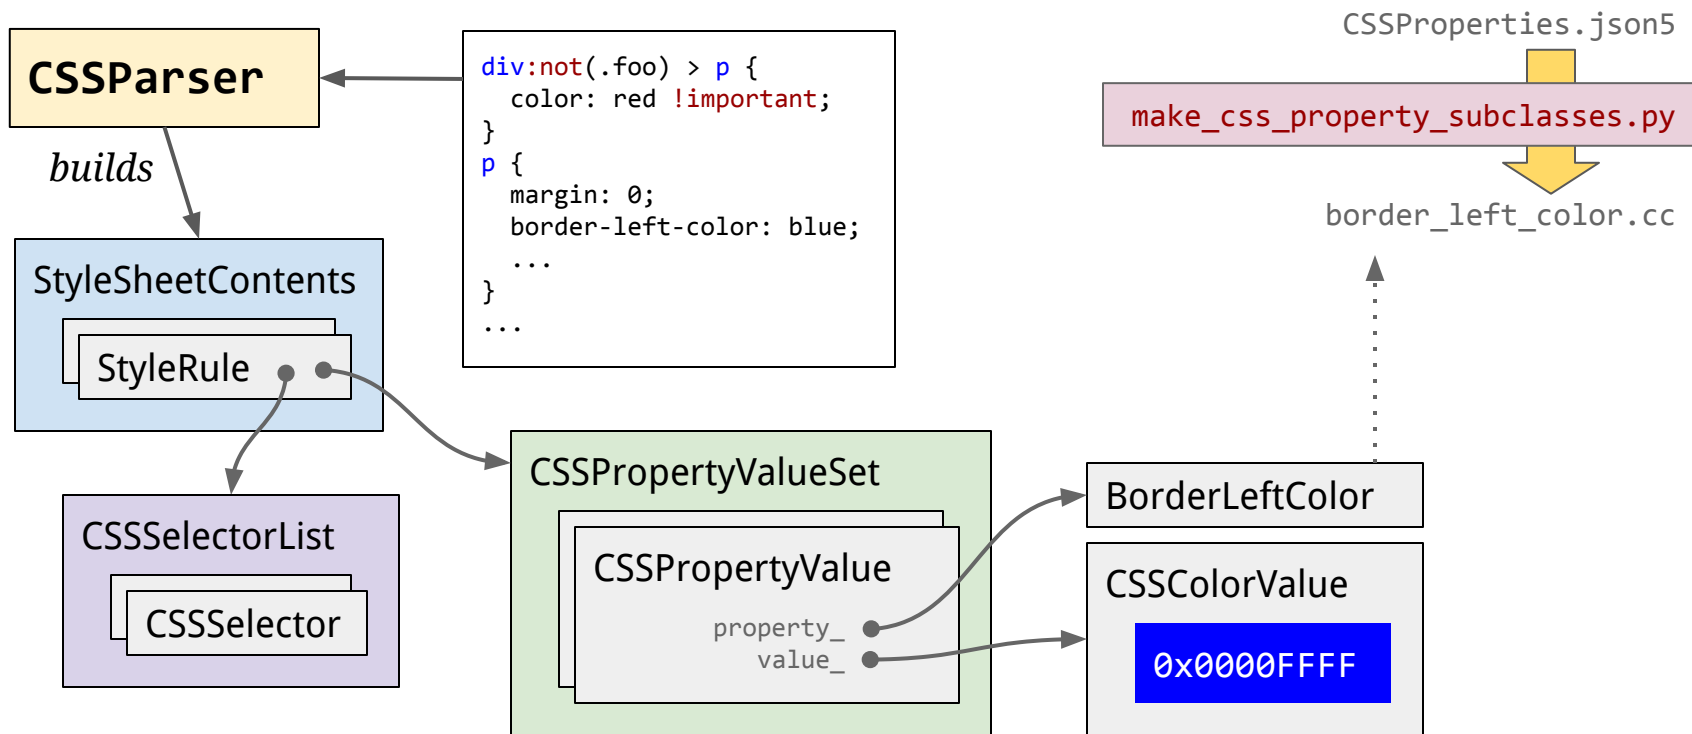

style

```
/* every other <p> in any <div> without class="foo" */  
div:not(.foo) > p:nth-of-type(2n) {  
    color: red !important;  
}
```

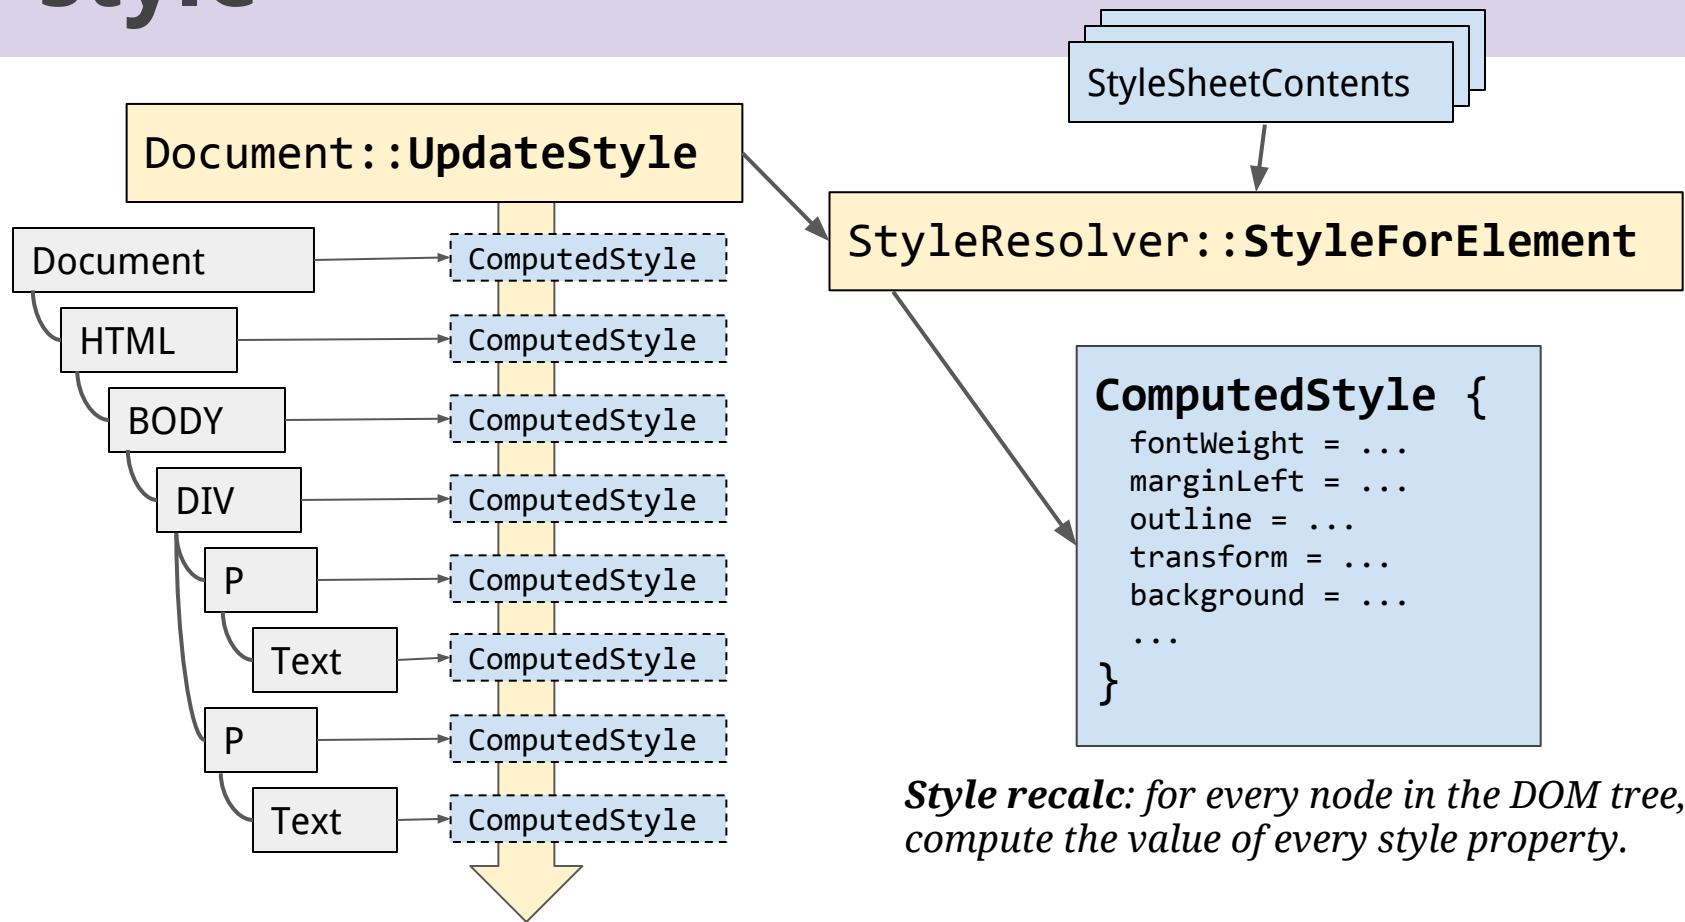

```
p {  
    color: blue;  
}
```

- *selectors can be complex!*
- *declarations may conflict!*

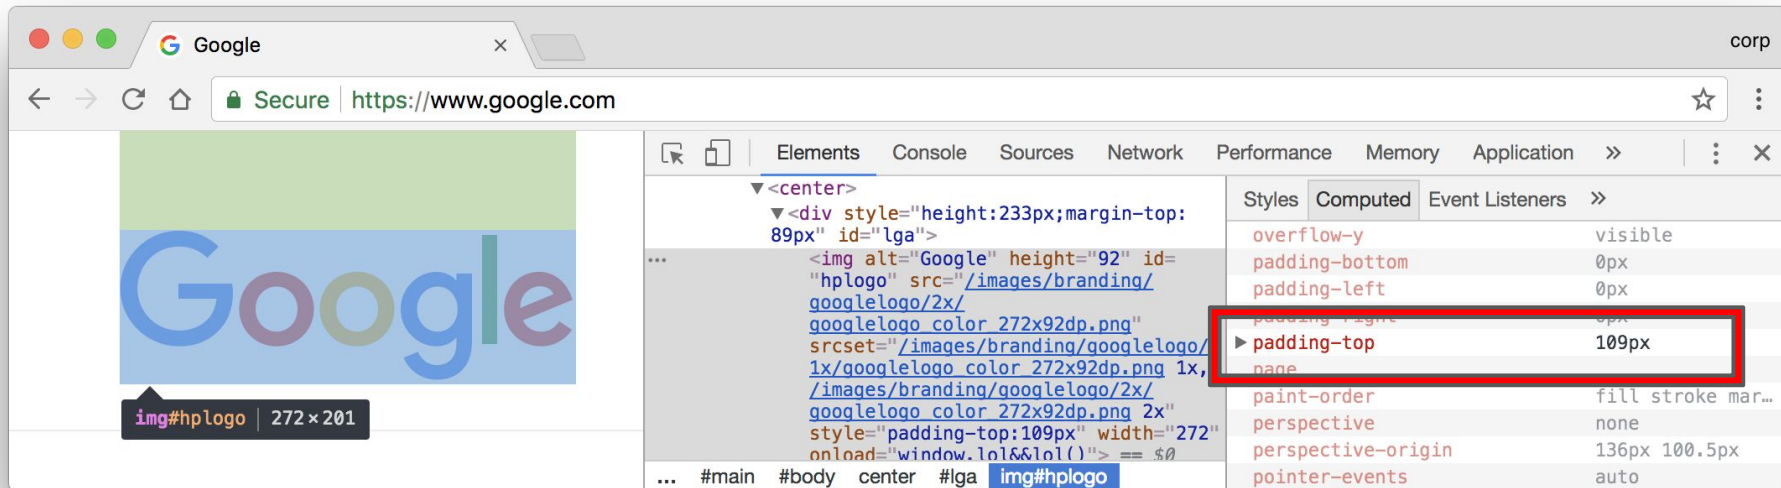

style

style

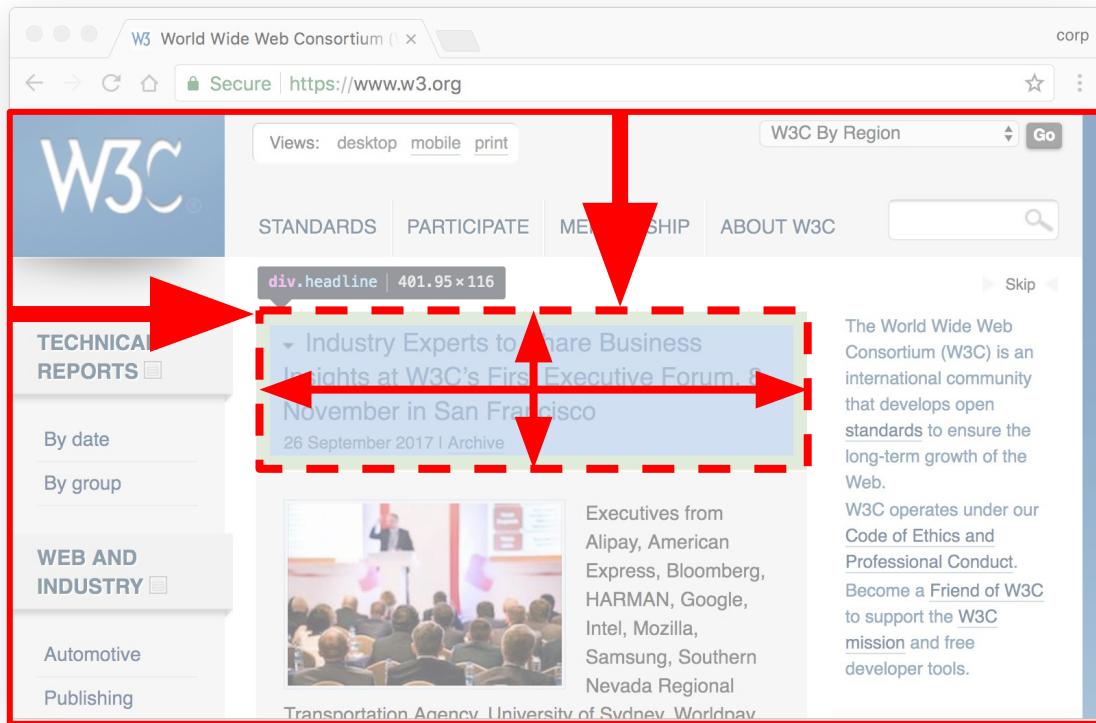

style

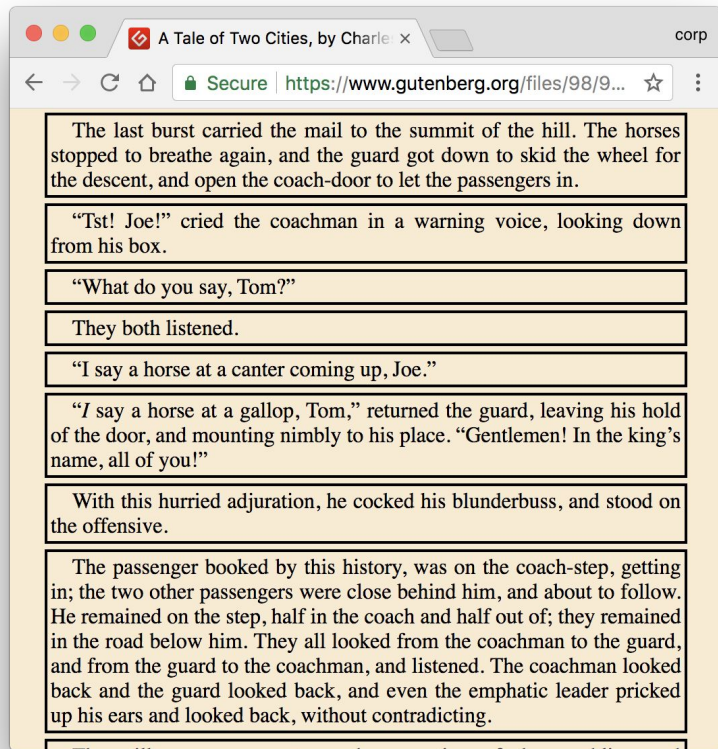

```
getComputedStyle(element)["padding-top"]
```

[JS]

layout

layout

block flow

Simple "block" layout objects are placed one after another, flowing down the page.

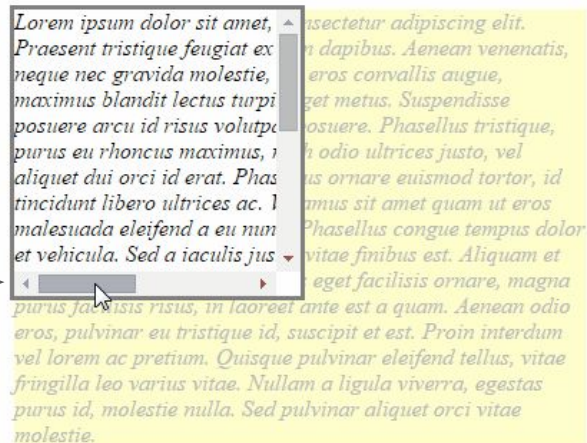

(Line breaking is not simple.)

layout

The contents of a layout object can **overflow** its border box.

Overflow can be visible, hidden, or **scrollable**.

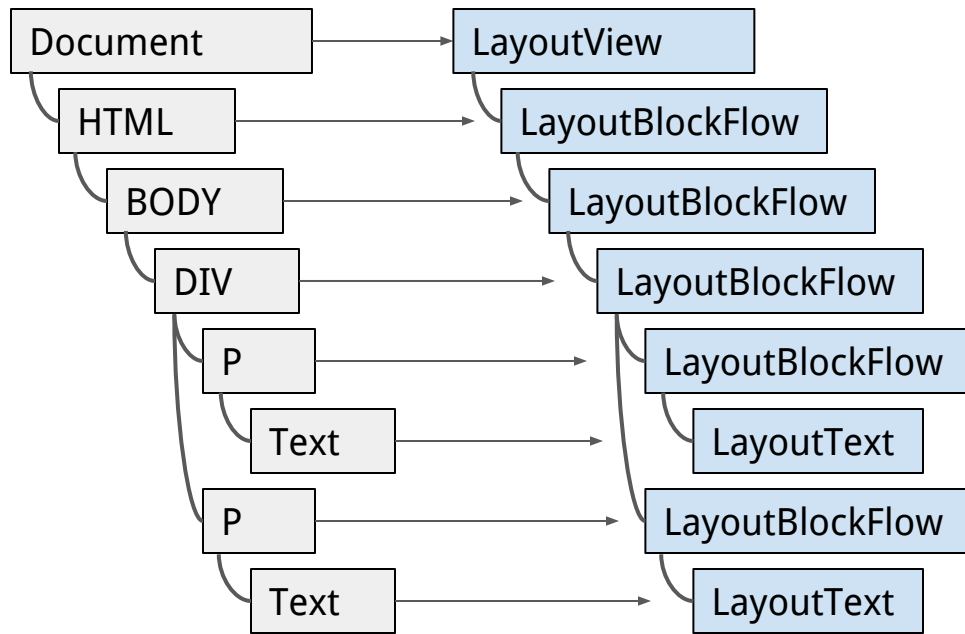

layout

Other kinds of layout are even more complex.

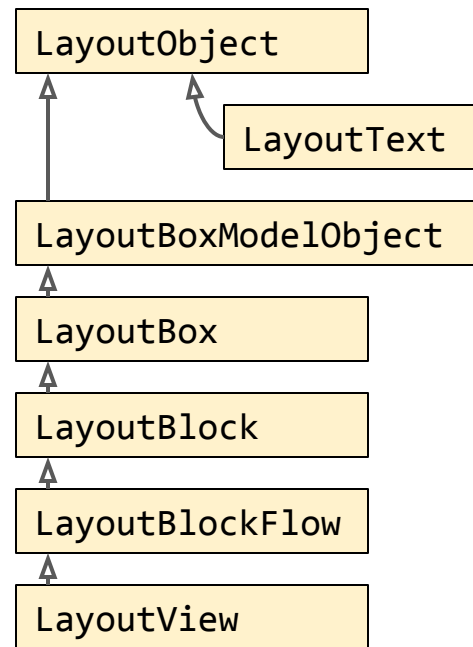

- `<table>`
- `float: left`
- `column-count: 3`
- `display: flex`
- `writing-mode: vertical-lr`
- ...

layout

DOM tree

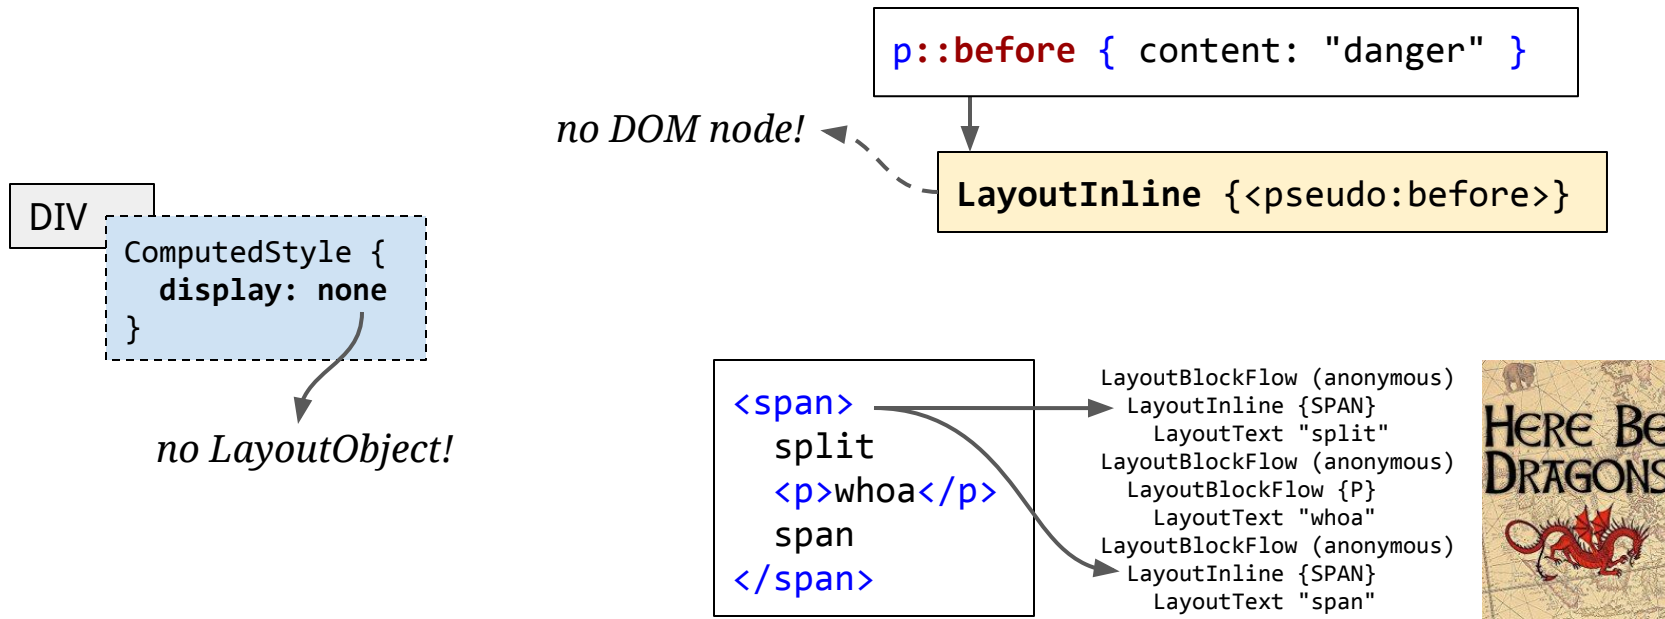

layout tree

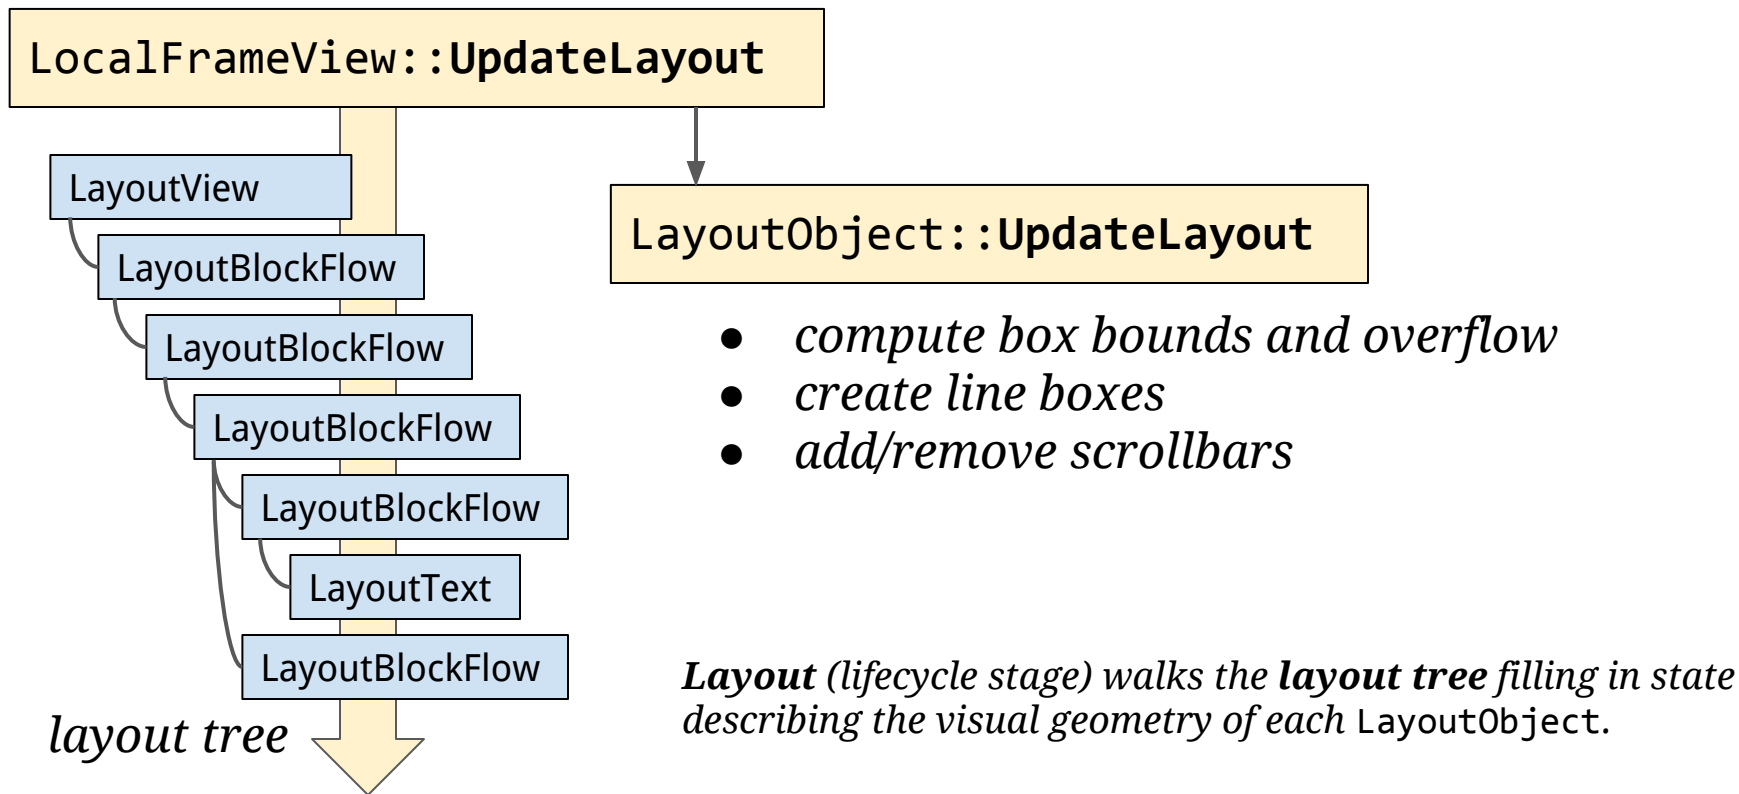

C++ class hierarchy

layout

DOM nodes are **mostly** 1:1 with layout objects, with some exceptions.

layout

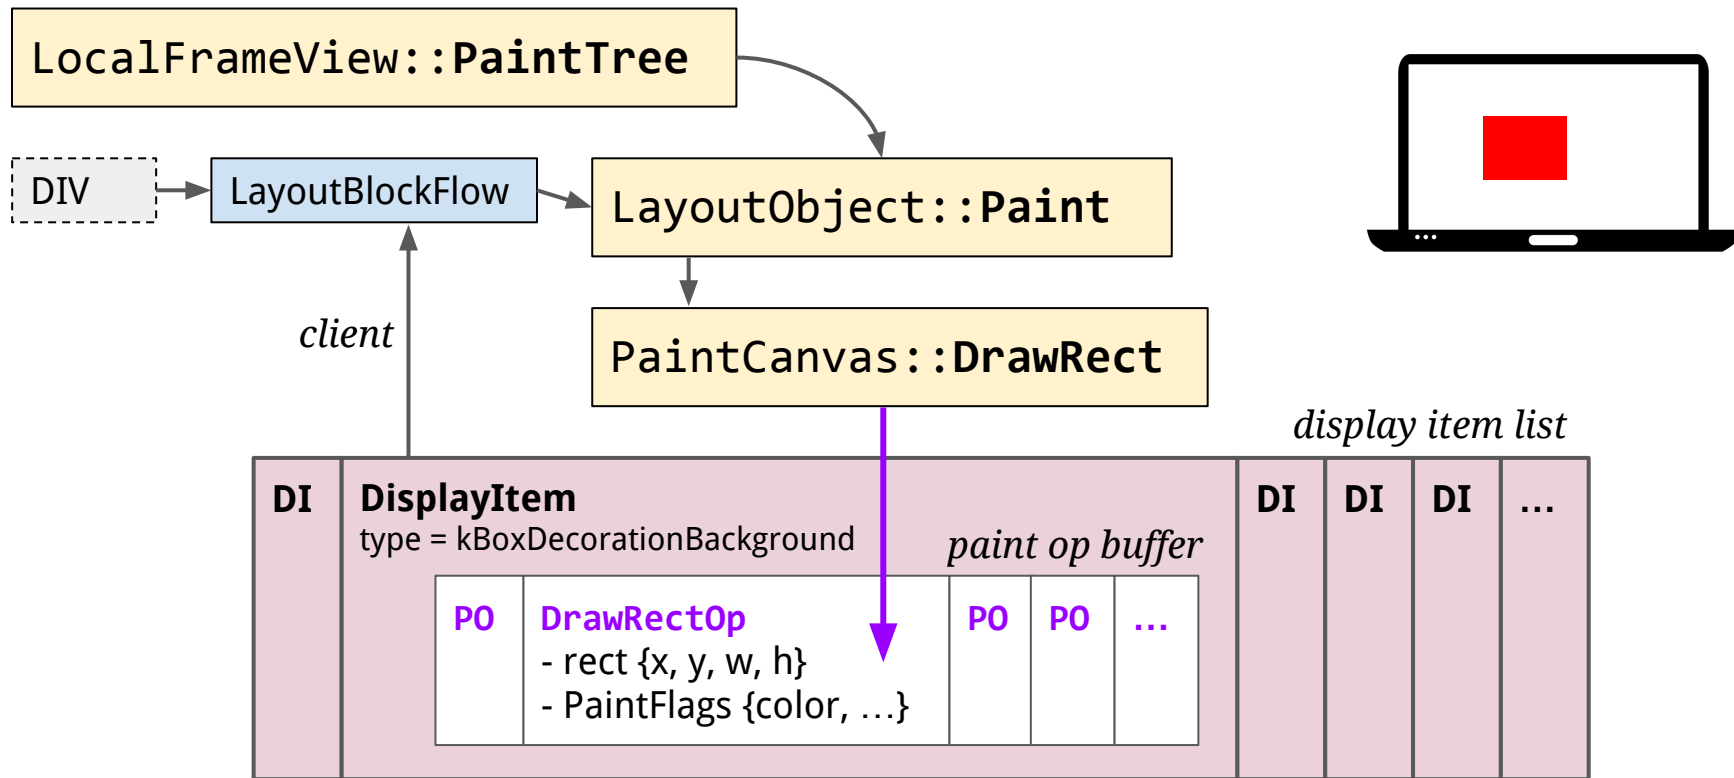

layout

A new system called **LayoutNG** will separate inputs from outputs more cleanly.

paint

paint

*Paint uses **stacking order**,
not DOM order.*

```
<div class="yellow"></div>
<div class="green"></div>
<style>
  .yellow { z-index: 2; ... }
  .green  { z-index: 1; ... }
</style>
```

DOM tree

yellow paints last

paint

*Each **paint phase** is a separate traversal of a stacking context.*

*paint phases
(simplified)*

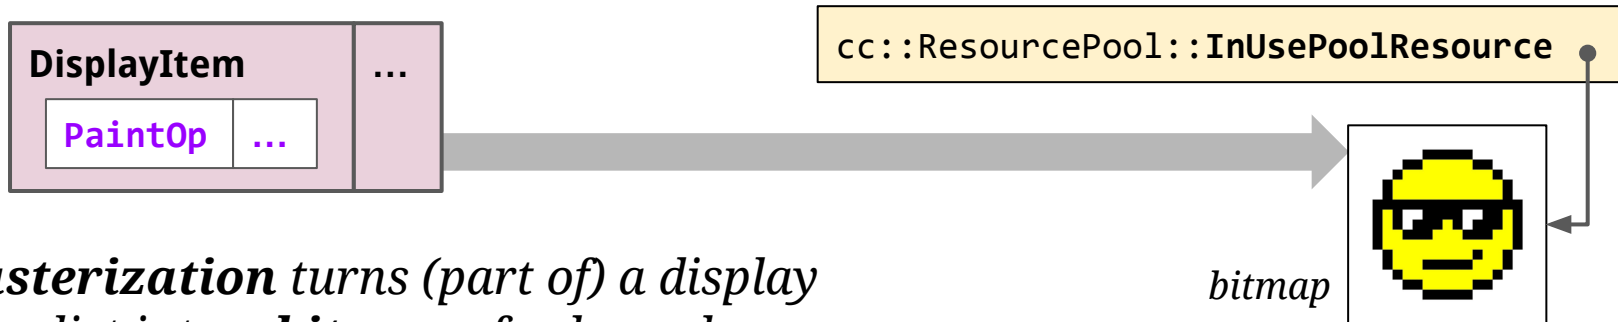

```
<div id="green">  
  green's text  
</div>  
<div id="blue"></div>
```

*blue after green, but
foregrounds after backgrounds*

raster

***Rasterization** turns (part of) a display item list into a **bitmap** of color values.*

FFFF	FFFF	0000
FFFF	FFFF	00FF
FFFF	0000	FFFF
FFFF	00FF	00FF
0000	FFFF	FFFF
00FF	00FF	00FF

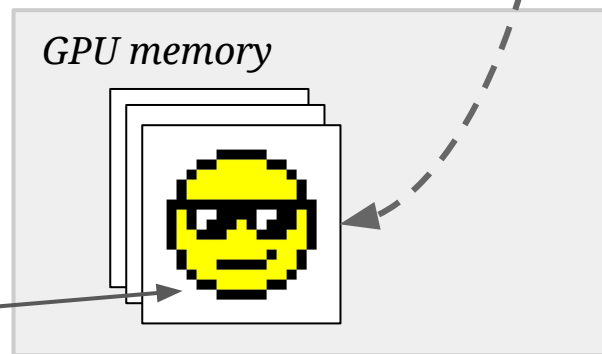

(red, green,
blue, alpha)

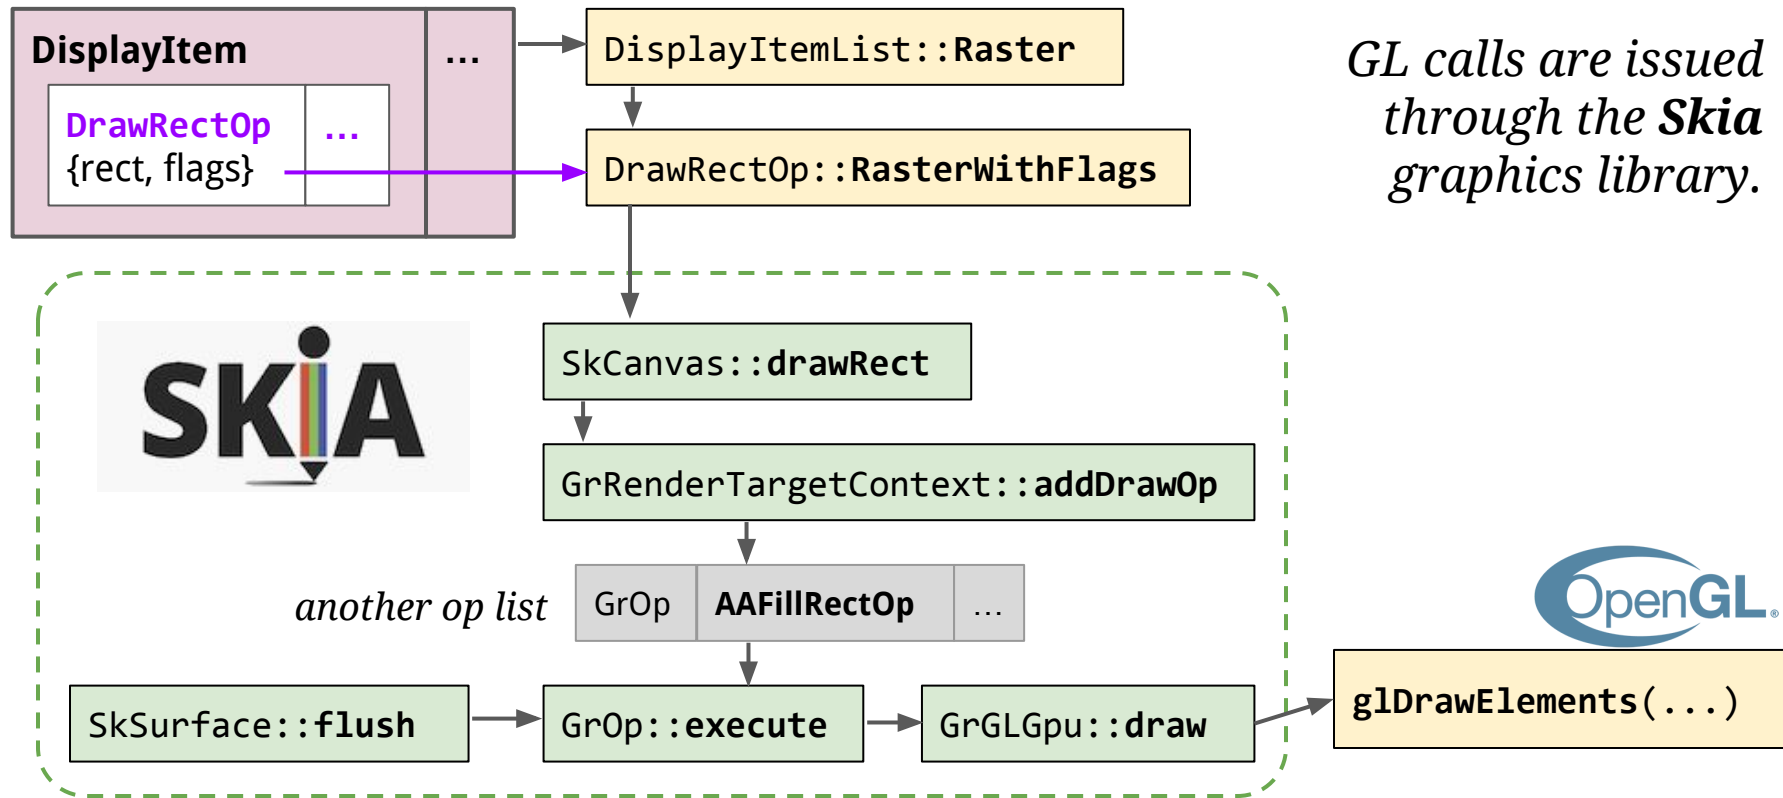

raster

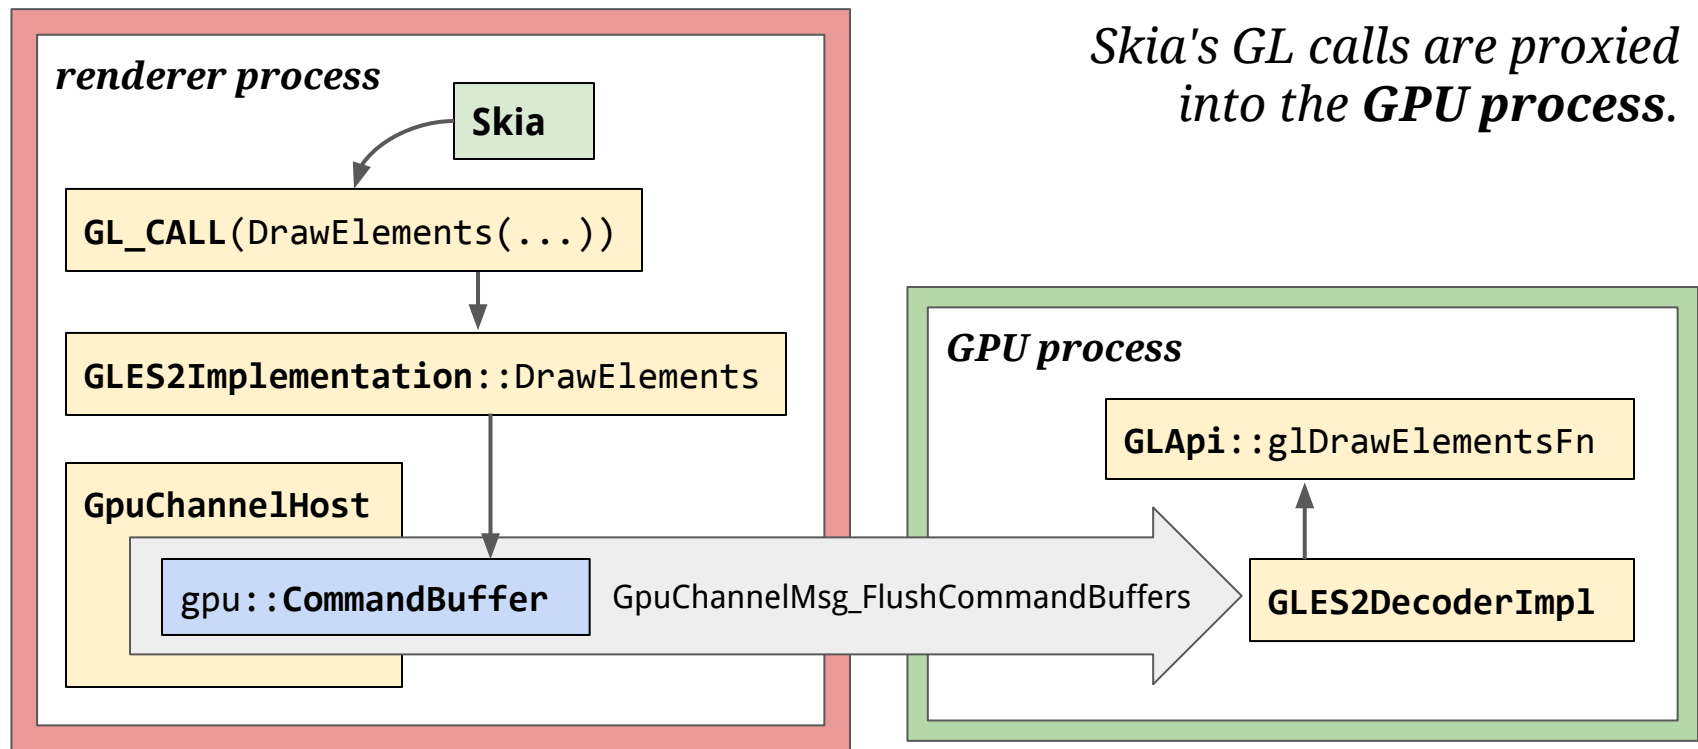

*Rasterization can be **accelerated** by the GPU.*

raster

gpu

gpu

GPU process

`GLApi::glDrawElementsFn`

`dlopen("libGLESv2.so")`
`dlsym("glDrawElements")`

`LoadLibrary("libglesv2.dll")`
`GetProcAddress("glDrawElements")`

*The GL functions are dynamically linked.
On Windows, we translate to DirectX.*

gpu

In the future, raster will happen in the GPU process.

change

(in memory)

*We now have a complete **pipeline**.*

*But what if state can **change**?*

- scrolling
- zooming
- animations
- incremental loading
- JavaScript
- ...

"Change is good."
"Yeah, but it's not easy."

frames

*The renderer produces **animation frames**.*

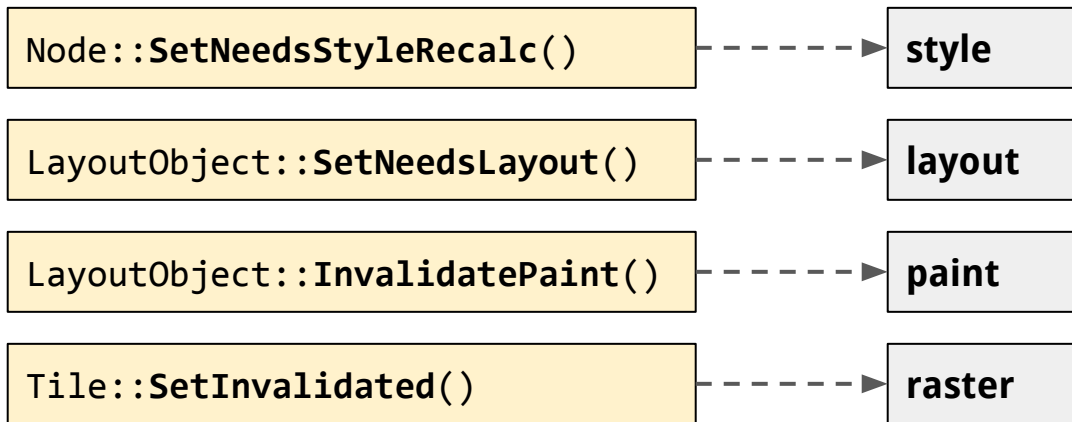

*Below 60 frames per second,
scrolling and animations look "janky".*

■ = time spent to render the frame

invalidation

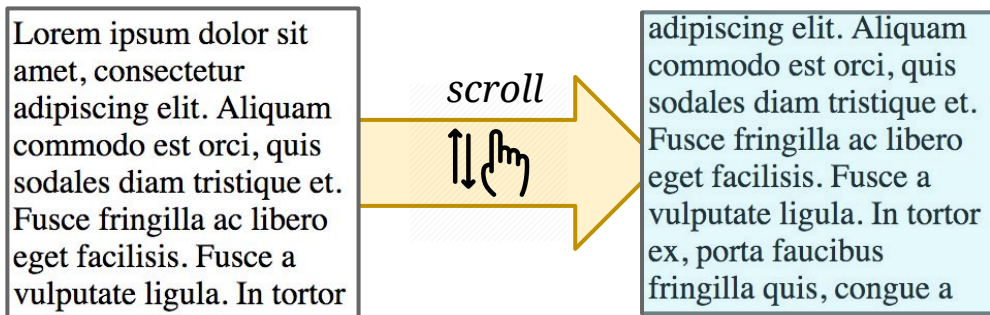

*Each pipeline stage tracks granular asynchronous **invalidations**.*

Outputs are reused from previous frames when possible.

repaint

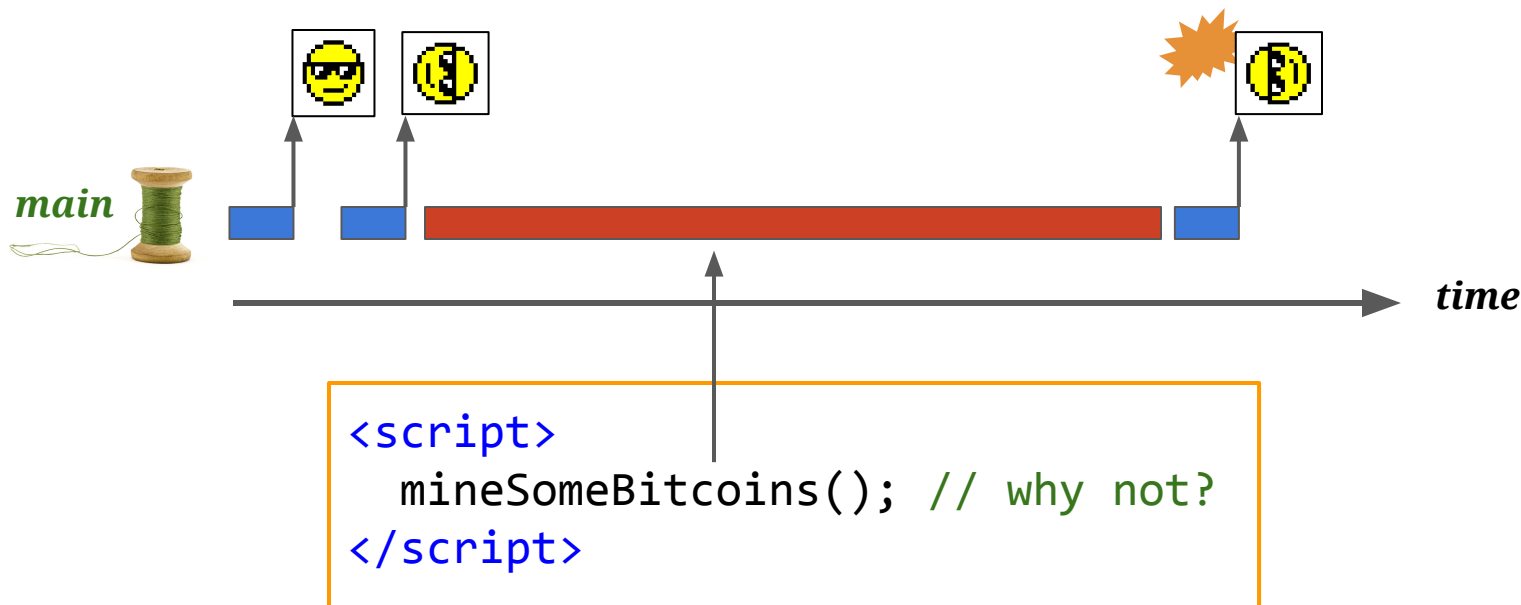

Paint + raster remain expensive if a large region is transformed...

all the pixels changed!

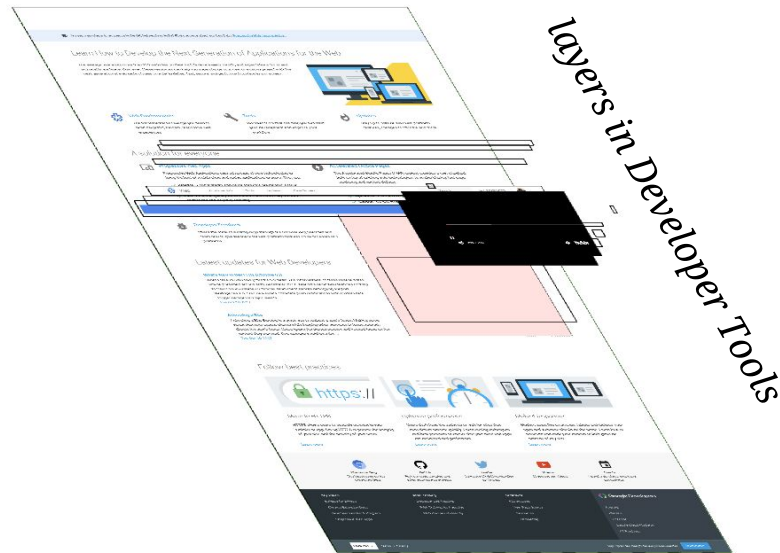

jank

... and anything on the *main thread* competes with JavaScript.

enter: compositing

- *Decompose the page into **layers**.*
- ***Composite** the layers on another thread.*

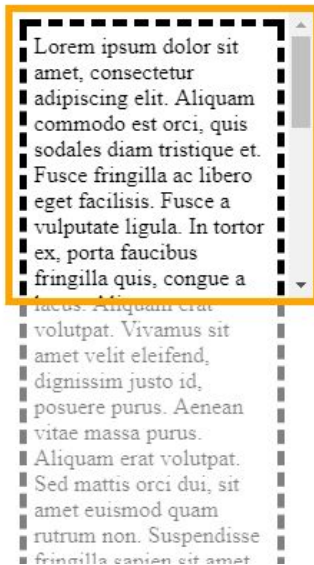

** ("impl" = compositor thread) $\neg(\text{ツ})\neg$*

compositing

Animation:
a layer moves

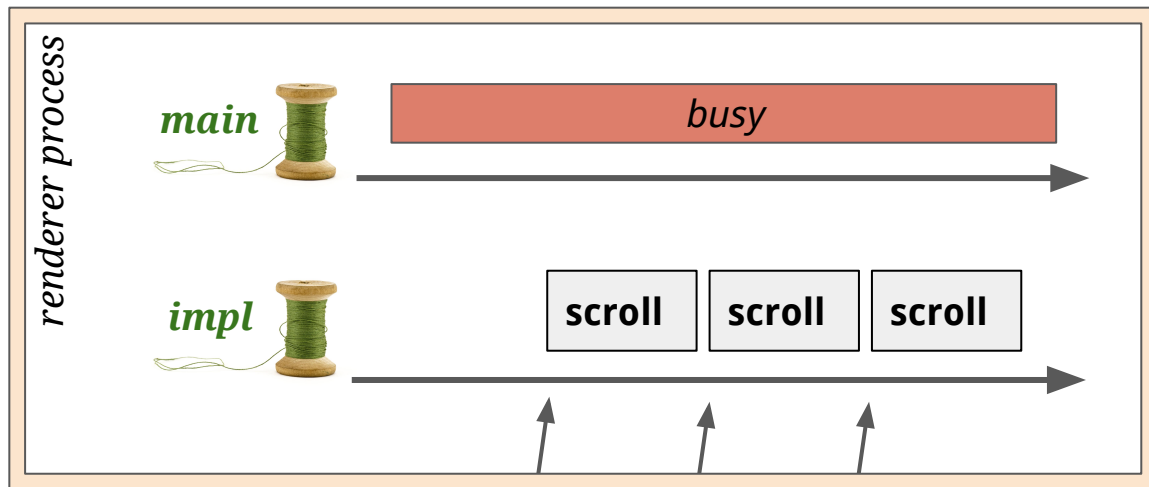

Scrolling:
*a layer moves;
another clips*

Pinch Zoom:
a layer scales

compositing

input from
browser process

The compositor thread
can handle **input** events.

layer tree

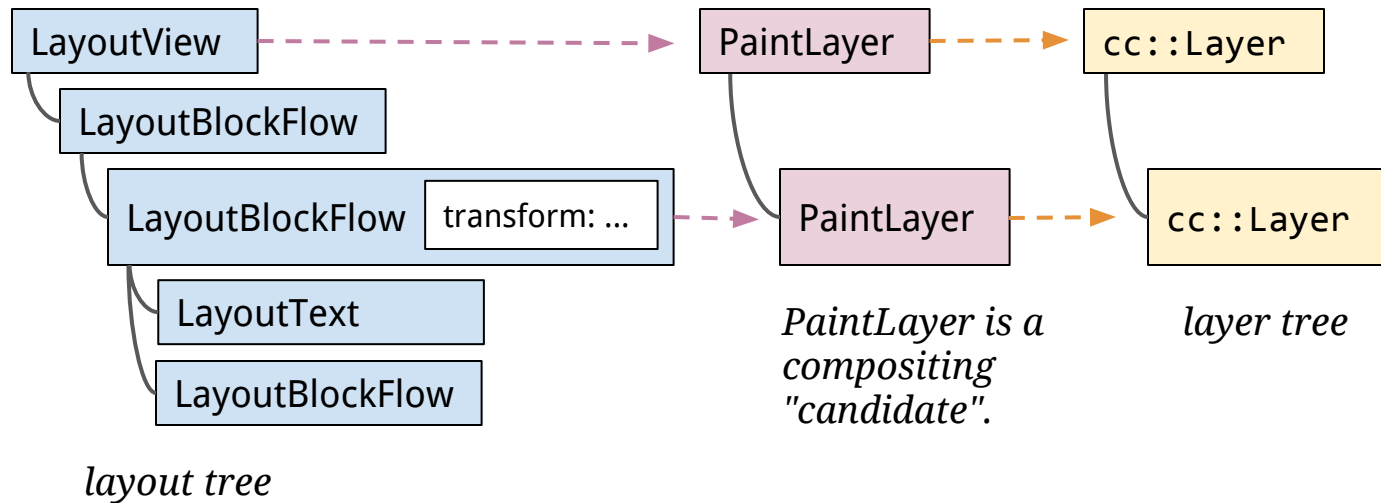

layer tree

Layers are also a tree!

- *"stacked" by preorder traversal*
- *can clip descendants, or apply effects*

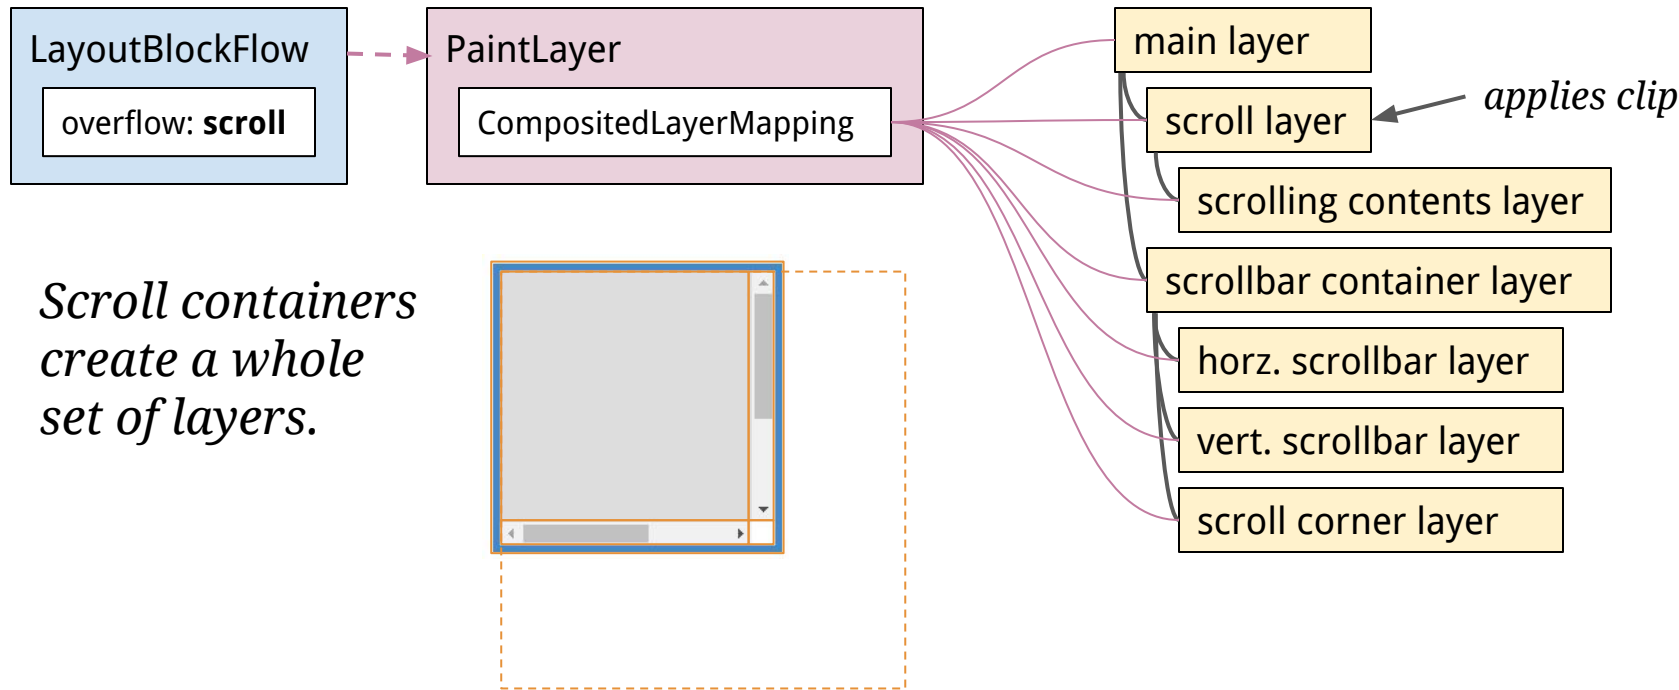

layer tree

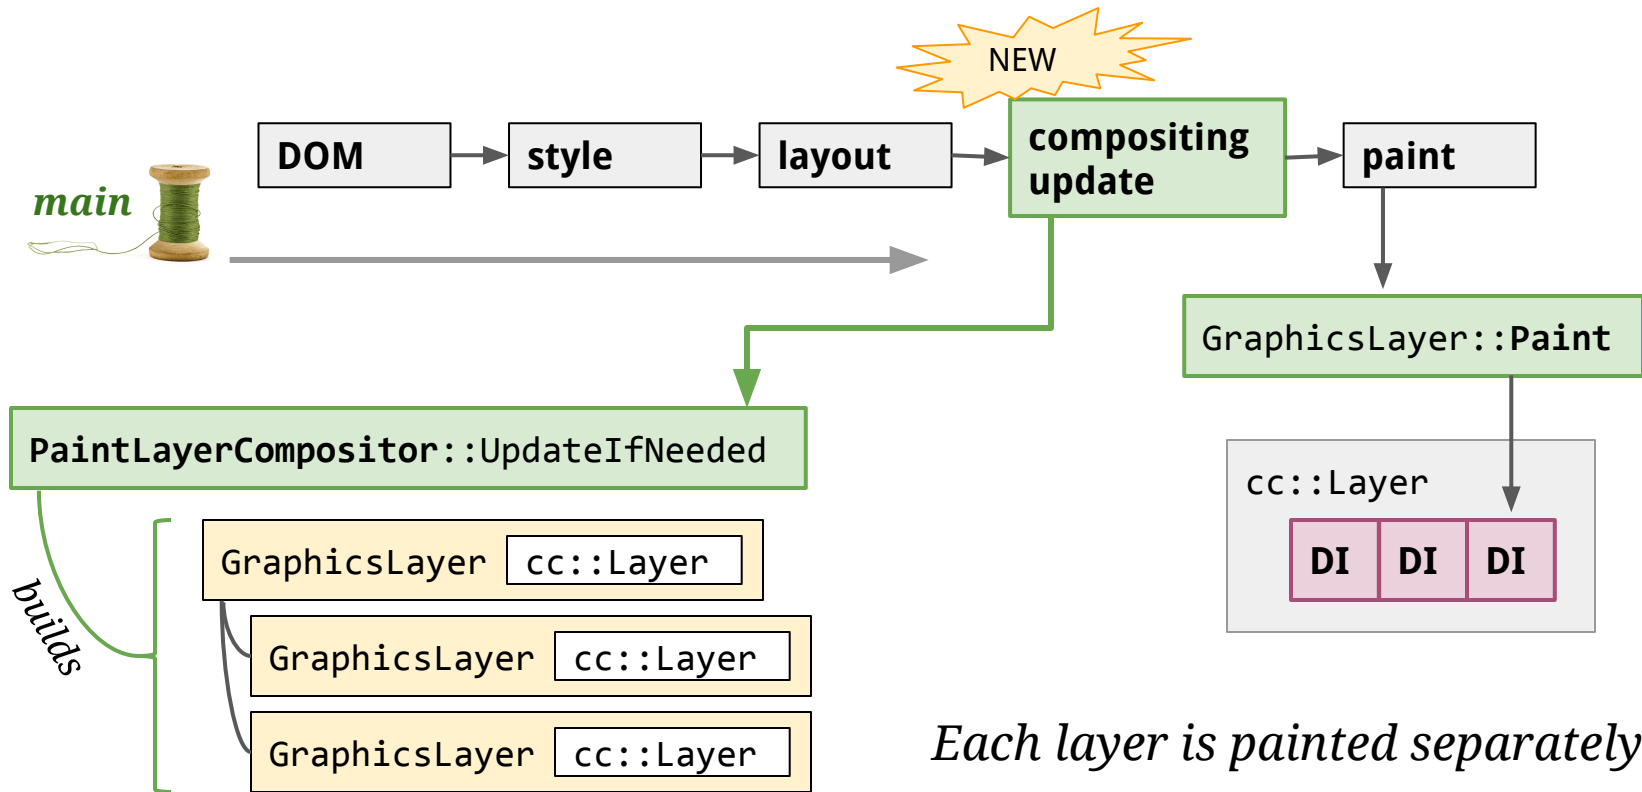

The layer tree is based on the layout tree.
